

“Gearing up for Gigabit” means more than just a faster router with a new 802.11 suffix and more MIMO. Delivering Gigabit WiFi to subscribers that are connecting more devices and streaming more video than ever before presents a daunting challenge for Service Providers. Gone are the days where a single WiFi Access Point embedded in the home router would serve the needs of the average subscriber. The home WiFi architectural model is shifting from centralized to distributed.

In this session, learn how Service Providers looking to monetize Whole-Home WiFi services must look to solutions that deliver not only the highest speeds but that also provide deeper management insight and capabilities than ever before – streamlining installation, optimizing airtime utilization and assuring seamless roaming; as well as detecting and resolving issues before the subscriber can even call for support. The best WiFi solutions for the gigabit home will ensure every subscriber device has a consistent, quality experience, throughout the home.
