

## **Wireless Innovation Allows Networks to Compete & Compliment Fiber**

Innovations in Wireless Technology can now enable Service Providers to better compete against fiber networks, or complement fiber networks by extending the ability to provide high-capacity connections to more customers.

Innovations in LTE for fixed wireless, leading into 5G NR technologies is an area of fast industry development and implementation. Adaption of mobile infrastructure standards to a fixed wireless solution can enable commercially viable solutions that create innovation in this space.

Not to be overlooked, however, are proprietary purpose-built fixed solutions that can apply development innovation more quickly by not being hampered by a “standards” roadmap or chipset constraint. Examples of creating innovation in this method will be highlighted.
